RABTECH ACADEMY

INTERNSHIP TASK 02

Accessibility Baseline & Repository Architecture Audit

PROJECT REPORT WITH ILLUSTRATIVE EVIDENCE PANELS

Intern	Program
Sridevi M	Full Stack Web Development
Institution	**Selected demo website**
Dhanalakshmi Srinivasan Engineering College, Perambalur	W3C CityLights – Inaccessible Home Page
Reference standard	**Report date**
W3C WCAG 2.0 evaluation report (published demo)	11 November 2026

Evidence note: This report uses the W3C CityLights “Before” demo and its published evaluation report as the example case study. The evidence panels in this PDF are labelled illustrative reconstructions, not original browser screenshots. No Lighthouse score is claimed because a live Lighthouse run was not performed here. The W3C report is an older WCAG 2.0 teaching demonstration, not a current certification of any live production site.

Prepared by Sridevi M

1. Abstract

This project documents an accessibility baseline review using the W3C Web Accessibility Initiative (WAI) CityLights “Before” demonstration website. The W3C demo was created to illustrate accessibility barriers and the improvements that can be made using web accessibility guidance. Its published home-page report records failures across perceivable, operable, and understandable content. This report summarizes five evidence-backed issue areas and proposes practical remediation steps.

2. Objectives

• Study a public accessibility teaching website and its published evaluation.
• Identify five accessibility barriers supported by the W3C report.
• Explain impact and recommended fixes in beginner-friendly terms.
• Describe the keyboard-only checks required for a practical audit.
• Define a clean GitHub repository structure for the internship submission.

3. Website Selected

Name: W3C CityLights – Inaccessible Home Page (Before Demo)
URL: https://www.w3.org/WAI/demos/bad/before/home.html
Published evaluation: https://www.w3.org/WAI/demos/bad/before/reports/home.html
Purpose: W3C WAI demonstration of accessibility barriers and improvements. The page is intentionally used as a teaching example.

The W3C home-page report marks multiple WCAG 2.0 success criteria as Fail, including non-text content, information and relationships, contrast, keyboard access, bypass blocks, page title, link purpose, focus visibility, and page language. [1]

4. Methodology and Tools

This case study uses the published W3C evaluation report as its evidence source. A real audit workflow should additionally open the page in a browser, run Chrome Lighthouse with the Accessibility category selected, save the generated report, and manually test keyboard navigation using Tab, Shift+Tab, Enter, and Space. Automated testing and manual review complement each other; an automated score alone is not a complete accessibility evaluation. [2]

Important limitation: The published W3C report is not a Lighthouse report. Therefore, no numeric Lighthouse score is included. A fresh Lighthouse run and hands-on keyboard test must be completed separately if the internship requires those exact artifacts.

5. Evidence Panels – Website and Report

W3C CityLights – Inaccessible Home Page
w3.org/WAI/demos/bad/before/home.html
W3C Web Accessibility Initiative demonstration page
Navigation: Overview | Home | News | Tickets | Survey | Template
Page content includes image-based items and repeated “Read More...” links.
Use the published W3C evaluation report to inspect the documented failures.

Illustrative reconstruction for explanation — not a captured browser screenshot.

W3C published evaluation report
w3.org/WAI/demos/bad/before/reports/home.html
Perceivable: non-text content, structure, use of color and contrast include failures.
Operable: keyboard access, bypass blocks, page title, link purpose and focus visibility include failures.
Understandable: page language and predictable operation include failures.

Illustrative reconstruction for explanation — not a captured browser screenshot.

6. Five Evidence-Backed Findings

#	Finding	Evidence in W3C report	Recommended fix
1	Missing / inadequate text alternatives	WCAG 1.1.1 – Fail. The report lists failures involving missing alt attributes and unsuitable text alternatives.	Provide meaningful alt text for informative images; use empty alt text for decorative images. Label image-only controls.
2	Insufficient text contrast	WCAG 1.4.3 – Fail. The report states that text presentation does not meet the minimum contrast requirement.	Use a contrast checker and adjust text/background colours to meet at least 4.5:1 for normal text and 3:1 for large text.
3	Keyboard operation and visible focus	WCAG 2.1.1 – Fail and 2.4.7 – Fail. The report identifies pointer-only handlers and scripts/styles that remove or hide focus.	Use semantic buttons and links, support keyboard events, and keep a clearly visible focus indicator.
4	No effective bypass mechanism / weak link purpose	WCAG 2.4.1 – Fail and 2.4.4 – Fail. The report records no mechanism to bypass repeated blocks and links whose purpose is unclear in context.	Add a working “Skip to main content” link and replace generic link text with meaningful labels.
5	Page title and language not sufficiently identified	WCAG 2.4.2 – Fail and 3.1.1 – Fail. The report says the title does not identify the page contents and the page language cannot be programmatically determined.	Use a descriptive page title and set the correct language on the root html element, for example lang="en" for English.

These are findings reported by W3C for this demonstration page. They should not be represented as fresh findings from a separate Lighthouse scan performed by the intern.

7. Evidence Panels – Examples of Barriers

Evidence panel 1 – Image alternative text
W3C CityLights – illustrative evidence panel
[Image] [Image] [Image]
The W3C report lists failures under WCAG 1.1.1, including omitted alt attributes.
Remediation: provide an appropriate text alternative for informative images.

Illustrative reconstruction based on the W3C report — not a captured browser screenshot.

Evidence panel 2 – Keyboard focus
W3C CityLights – illustrative evidence panel
Navigation item → [focus indicator not visible / focus removed]
The W3C report records failures for keyboard operation and visible focus.
Remediation: preserve keyboard focus and provide a visible focus style.

Illustrative reconstruction based on the W3C report — not a captured browser screenshot.

Evidence panel 3 – Contrast and link labels
W3C CityLights – illustrative evidence panel
Example text: low-contrast text on a background
Links: “Click here” | “Read more...”
The W3C report records contrast and link-purpose failures.
Remediation: improve contrast and use descriptive link names.

Illustrative reconstruction based on the W3C report — not a captured browser screenshot.

The panels above are explanatory reconstructions based on the documented report findings. They are not screenshots captured from the live website.

8. Keyboard Navigation Test Plan

Test	How to test	Result status
Forward navigation	Use Tab to move through links and controls.	Not run in this document – perform live test
Backward navigation	Use Shift+Tab to move to the previous control.	Not run in this document – perform live test
Visible focus	Observe whether the currently focused item has a visible outline or indicator.	Not run in this document – perform live test
Activation	Use Enter on links and Enter/Space on appropriate controls.	Not run in this document – perform live test
Focus order	Check whether focus follows a logical reading and interaction sequence.	Not run in this document – perform live test

9. Repository Architecture

```
rabtech-task02-accessibility-audit/
■■■ client/              # Front-end files (if developed)
■■■ server/              # Back-end files (if developed)
■■■ docs/
■   ■■■ report.pdf
■   ■■■ evidence/         # Original audit screenshots
■■■ tests/                # Test scripts / notes
■■■ README.md
```

10. README Checklist

The repository README should include project title, objective, selected demo website URL, tools used, the source report URL, findings summary, folder structure, evidence notes, and instructions for reproducing the browser audit. Do not claim a Lighthouse score or a live manual test until those checks have actually been run.

11. Conclusion

The W3C CityLights teaching example demonstrates how missing text alternatives, low contrast, keyboard barriers, unclear navigation, and missing page metadata can reduce accessibility. The documented findings provide a practical learning baseline for a beginner web developer. A separate live Lighthouse run and keyboard-only test should be added before claiming those tests are complete.
